

MAGNETIC LINEAR MEASUREMENT 1100

description

Sensors for the detection of changes in position (linear) or angular change (rotating), which can detect the distance and direction of path and/or change of angle and direction of rotation are referred to as incremental encoders. The path measuring system consists of two parts: The sensing head and the magnetic tape. On the 10mm wide magnetic tape, north and south poles are alternating in a longitudinal direction with an exactly defined pole width. The magnetic tape is protected by a carrier strip on the rear and by a magnetically permeable masking tape made of stainless steel. A double-faced adhesive tape glued to the rear side is used as a fixture.

The sensing head mounted above the magnetic tape consecutively senses the different poles. From the sinusoidal signal which is generated, the integrated electronic system forms square wave signals.

These can be processed directly via a counter or a control.

The sensor element has a width of 5mm and is located in the center of the sensing head. In environments with dust, chipping, moisture or mechanical impacts, a protective aluminum section (AM000050) can be screwed above the magnetic tape (AM000059). The maximum tape length is 80m.

The precision of the system, taking into account the magnetic tape length "L" in meters is $\pm(0.025 + 0.01 \text{ x L})$ mm. The magnetic tape has to be 55mm longer than the required measured distance.

For the further evaluation please connect the multifunction counter **CI050100**.

application examples

 Linear measurement under toughest ambiance conditions
